# QlikView® for compliance & risk management

QlikView helps reduce the internal analytical and data silos that prevent business leaders from gaining an enterprise-wide view of compliance and risk. The QlikView Business Discovery™ platform allows finance and risk managers to rapidly integrate data from multiple sources, investigate information with the associative experience, and align governance models with business for greater overall transparency. Business users can freely explore large volumes of risk data and quickly respond to unplanned inquiries, minimizing the manual efforts related to custom risk reporting and analysis.

Complete view of compliance and risk

Data needed for compliance and risk management is typically created and stored on disparate technology stacks, produced in different geographies, and organized by different categories. The challenge is not only establishing an enterprise view of risk information, but additionally producing insightful, accurate, and actionable analytics apps. QlikView not only provides a holistic view of information, but enhances the ability for managers to discover different areas of risk to mitigate them before they occur. With the associative experience, managers can easily investigate information in any way the need to, leading to decreases in risk, fines, penalties, and fraud.

Key product features

QlikView offers Business Discovery capabilities that unlock the power of information for Compliance & Risk Management

- **The associative experience**
  Allows non-technical users to explore by making selections and getting instant feedback on what data is associated and what's unrelated

- **Data visualization**
  Provides summarized data and key risk KPI's in highly visual and interactive charts and graphs

- **Global search**
  Offers keyword search across entire data set, to pinpoint the 'needle in the haystack'

- **Rapid multi-source data integration**
  Provides a single, holistic view of financial and risk information from multiple sources and silos

- **Transaction-level detail**
  Empowers users to drill down to granular detail, increasing effectiveness and accuracy of risk investigations

- **QlikView Expressor**
  A simple and flexible metadata management tool that allows business communities flexibility while giving data management a central function for ensuring data quality across QlikView deployments

Work with business, not against it

Regulatory compliance is often seen as imposing requirements on the enterprise that don't provide much value in return. Such a mandate fails to recognize the substantial business value that reducing risk and increasing transparency can deliver. With QlikView, compliance can align with business processes and strategies and enhance them, rather than hinder them. Users can increase the frequency of meaningful insights that not only help to ensure compliance but also drive business performance.

QlikView® Expressor

QlikView Expressor is QlikView's solution for global metadata management. It provides administrators with a holistic data management capability in their QlikView environment, while allowing business users to create their own analytics apps with confidence. Expressor allows for common data definitions to be defined that ensures data governance and reduces risk.
